

Weather Any Storm With Digital Transformation Technologies

Digital transformation is the concept of moving to the cloud. It's a holistic approach to transforming your business in both technology and mindset. With the technologies involved in a digital transformation, your business will suit up with armor to stave off the blows of any future crisis.

How? Here are the cloud technologies that will add each layer of armor to your business so you can weather any storm:

Disaster Recovery as a Service (DRaaS)

With hosted disaster recovery, your business data and applications are safe in the event an outage or disaster occurs. ***A secondary site for recovery can be the helmet that saves your business from any potential crushing blow.***

Infrastructure as a Service (IaaS)

Cloud-based processing services are the core structure of secure IT. With IaaS, a third party hosts your hardware, software, and storage, so you're protected in any event.

Unified Communications as a Service (UCaaS)

Make sure the communication arms of your business won't miss a beat should anything go down. With hosted communications technology, customers won't notice a thing!

Security as a Service (SECaaS)

Keep your most vulnerable parts protected with outsourced security. This cloud-based service ensures no part of your business is exposed!

Desktop as a Service (DaaS)

Each employee is like a leg of your business. Keep them moving by enabling each of them – regardless of location or device – to securely log in to your corporate network. With your desktop in the cloud, your data stays safe in every circumstance.

With the right suit of armor, your business will be ready to face any foe. **Contact Enterprise Visions** to leverage our decades of experience in digital transformation to prepare for battle today.
